Amendment to the Abstract

Please replace the text of the Abstract, in its entirety, with the following new Abstract:

--Methods and apparatus determine the location of a peripheral, such as a multi-function peripheral. A method comprises the steps of sending a first message to the peripheral server, wherein the first message is formatted as a print job and contains an address of the client; and receiving at the client a second message containing the peripheral address. An apparatus comprises a client computer, a peripheral server and a peripheral. The peripheral server receives a first message from the client computer. The first message is formatted as a print job and contains an address of the client computer. The peripheral receives the first message from the peripheral server and notifies the client computer of the peripheral's address. The client computer can thereafter access a non-printer function of the peripheral using the peripheral's address and without using the peripheral server.--
